EA Controls

Hello and welcome. I'll guide you through the settings of the Expert Advisor (EA) and explain how each one functions. Let's begin by opening the EA properties to review the settings.

First off, the email field is essential as it's used to validate your license. Moving on from the email, the other settings might not seem as crucial until we get to the maximum slippage. Maximum slippage represents the highest deviation in points you're willing to accept for trades, in case the instant price shifts. You can set this value directly in points.

Next, we have the trading direction setting, which is by default set to both. This allows the EA to execute both buy and sell signals. If you prefer, you can adjust this to 'buy only' or 'sell only' to restrict trading to one type of signal.

Following that, there's the allow news signal setting. If this is set to true, your EA will act on news trading signals sent by the master. If set to false, it will ignore any orders tagged as news.

The lot size setting dictates the volume of the lot to be traded per signal, essentially determining the unit lot size for each order.

For the 'copy TP' (Take Profit) setting, when enabled, it allows the copying of TP values from the master. If disabled, it won't copy these values. If a trade has multiple TP levels, like TP2, TP3, and TP4, there are specific settings to determine the number of trades opened for each TP level. You can assign the number of trades you wish to open for TP1, TP2, TP3, and TP4, or set it to zero if you do not want any trades opened for a specific TP.

We also have a setting that sets total number of orders to be opened if there is only one TP. This is essential for scalp or news trades, if a trade is sent and has only one TP then it will open these number of trades. Additionally, you can limit the number of active trades per TP level. This feature checks if the current trades haven't exceeded the maximum allowed for that TP before opening new ones, helping to prevent overleveraging your account.

The copy SL or Stop Loss setting decides whether to copy SL values. If set to not copy, trades will open without a stop loss. The stop loss offset adjusts your stop loss value by a percentage. For instance, a setting of 100 copies the stop loss exactly as provided, 200 doubles it, and 80 adjusts it to 80% of the master's value.

You can activate break even function and trailing stop if required.

Symbol mapping is crucial for aligning the instruments from the master to those available on your broker's platform, due to different naming conventions. For example, if the master trades NASDAQ and your broker lists it as nas100, you'll need to map NASDAQ to nas100 in the client settings. This ensures your EA trades the correct instrument under your broker's naming system.

Change the Client list of instruments to the one your broker uses. By default we have: **US30,NASDAQ,GER30**. If your broker calls **U30** as **DJ30** and **NASDAQ** as **US100** and **GER30** as **DE30**, the change the list to **DJ30,US100,GER30**.

Lastly, the time restriction setting, if enabled, defines the specific time window in which the EA can execute trades. Signals received outside this timeframe will not be copied, allowing you to focus on trading during preferred sessions and avoid others.

Thank you once again for choosing Auto Trade Copy. We're excited to support you on your journey to greater success.
